MAFIA

A party game where group of people gathers and play it. Here there are civilians, mafia, police, god, doctor. Skribble type system

Every player will be sent an private invite link. A game session will be start.The one who sends the invite link is the god (will have to enter his/her name), every player then enters their name and joins the room.The god will then click on “assign roles”. Here god will assign the roles to the players. Based on the number of players suggestions will be give (ex: if there are 5 pleople and god tries to make 3 mafia then it is simply not possible, so suggestions are given). The total mafia count, doctor, civilian count will be shown to the god only.

After assigning roles. The god will click on start game play. The roles will be not emitted to every player realtime (no-realod). Now the round starts, no times nothing just a button given to god to go to voting panel. There will be preprompted voices (Ex:- civilians go to sleep, mafia wake up, who do you want to kills, etc), god can choose using the preprompted voice or can choose his manunal(real-life). Once the discussion is over in realtime, god will click on voting. Every player will do the voting from there play-screen, and god clicks voting done, the player with maximums votes will be eliminated. No identity of the eliminated player would be shown to anyone until the round is finished. After voting give a 3-5 second loading screen fromm round 2 sayinig “player was tied to an electric chair and died, “player was thrown by the civilians from and building and died”, etc.Then god will start the next round.

Anyone whose connection gets failed, can rejoin with the same username.

Note:- Store the session in the browser instead of using token(its not feasible for the user to type token, or give manually generated token which would be easier to type ex:- if room code is ROOM1234, then the reconnect token should be ROOM1234$username). Storing session in browser would be efficient

Also give a button to god on “assign role” to randomly assign roles.

Before giving roles, god will select how many mafia(3 mafia max) will be in game, is there a doctor/ police(these roles are maximum one).based on the number of roles selected and based on the number of players, the suggestion will be shown (if-else).

If doctor saves the player the mafia killed, the player is not killed. Doctor can save himself.

The police can check who do he want to check.

There would be screen to god to click prompts “all sleep”, then then button changes to “mafia wake up”, then “who do you want to kill” on this screen the mafia can point to the player they want to kill in real life and the god will select that player, or the mafias will select the player they want to kill from their phone and the god can see who the mafias want to

kill, then the god will click “go ahead”, then next promot “doctor wake up”, “who do you want to save” on this screen the doctor can choose the player from his own screen. Or he can point in real life and god will chose. Both will be shown the same screen. Same goes for the police. God can give thumbs up in real life, or he system will give thumbs up to the policeo n his screen id the selected player is mafia.

Tech stack:- react+tailwind, node+Express, prisma+neon+postgresql, zod+socketio

Folder structure:- backend/src/modules/…

The important boundaries are:

- room: creates rooms, generates invites, manages membership and reconnection.
- roles: validates role composition and assigns roles.
- game: owns the phase machine and God's controls.
- night: handles mafia targets, doctor saves and police investigations.
- voting: accepts ballots and closes voting.
- results: resolves deaths, checks win conditions and prepares the next round.
